

Enosh Earnest

Derby, UK | 07902 478381 | enoshearnest.com | [Email](#) | [LinkedIn](#) | [GitHub](#)

Final-year Computer Science student on track for a First, with experience across the full AI engineering stack, from building and shipping a live agentic platform (projectlevi.co.uk) to developing ML pipelines on industrial data for [Rolls-Royce](#). Experienced in LLM orchestration, prompt engineering, evaluation frameworks, and IoT-driven predictive systems. Aware that AI systems can fail in subtle, consequential ways, and committed to building systems that are not just capable, but measurably safe and trustworthy.

TECHNICAL SKILLS

Backend & Core Engineering: Python, SQL, REST APIs, FastAPI

Cloud & DevOps: Microsoft Azure, Docker, Git, Google Cloud Platform

AI & ML: Agentic AI (LangGraph), LLM APIs (Gemini), Computer Vision (Google Vision API), Neural Networks (TensorFlow), Fine-tuning (LLaMA, Mistral), Predictive Modelling, AI-Augmented Engineering (Claude), RAG, Azure AI-103 (*in progress, expected July*).

EDUCATION

University of Derby

Bachelor of Science (Honours) in Computer Science

Expected: July 2026

IoT & AI Engineering | Rolls-Royce Collaboration

- Built an AI-driven predictive maintenance pipeline combining **Isolation Forest** anomaly detection and a **GRU forecasting** model, fused into a unified Health Score for industrial equipment diagnostics.
- Validated LoRaWAN IoT telemetry as a foundation for industrial AI, running calibrated lab tests against a reference standard across a 38°C thermal step change.
- Developed a production ML pipeline in **Python (TensorFlow/Keras, scikit-learn)** processing real wireless sensor data to automate anomaly detection, time-series forecasting, and Health Score alerting. Deployed for Rolls-Royce (**Vantage Project 12**).

EXPERIENCE

Co-Founder & Co-Developer | projectlevi.co.uk

May 2025 - Present

- Built and launched Project Levi. A full-stack agentic AI platform that analyses university students' skills and delivers personalised career roadmaps, using **Vue.js** on the frontend, **Python/FastAPI** on the backend, and deployed on **Google Cloud Platform**.
- Designed a multi-step agentic pipeline with **LangGraph** and **Gemini's API**, achieving 95% consistency in structured JSON outputs through iterative prompt engineering and state management.
- Built a custom **LLM-as-judge evaluation framework** using Gemini to track output accuracy and pipeline latency, keeping the system reliable as it scales.
- Next product update releasing on the 29th of May, actively iterating based on real user feedback.

LLM Trainer | Outlier (Remote)

Oct 2024 - Dec 2024

- Contracted by Outlier (San Francisco) to **improve LLM outputs** through hands-on prompt engineering, data annotation, and Python based code evaluation, directly contributing to model accuracy and response quality.
- Assessed and **critiqued AI-generated code** and reasoning across a range of tasks, developing a sharp eye for model failure modes and output consistency.
- Worked remotely within a **distributed team of LLM trainers**, maintaining consistent quality standards across a high volume of evaluation tasks.

PROJECTS

SEEC - A Public Transport App for the Visually Impaired | React Native • Node.js

[GitHub](#)

- Led a team of four in an **Agile/Scrum environment** to design and deliver a **voice-controlled mobile application** for [Journeio Plc](#), enabling visually impaired users to navigate bus journeys independently.
- Improved ease of following navigation instructions by 30% and **reduced user anxiety by 25%**. Implemented a dynamic voice feedback system using **Expo Speech** and **Google Vision API** to extract and vocalise text from street signs in real time, validated through structured user acceptance testing.
